- arXiv:0805.0757 w/ Massimo Bianchi and Dan Freedman
- arXiv:0710.1270 w/ Dan Freedman

1. Motivation

Is $\mathcal{N} = 8$ supergravity perturbatively finite?

Explicit calculations of loop amplitudes:

Use generalized unitarity cuts [Bern, Dixon, Kosower, ...]
to construct loop amplitudes from products of on-shell tree amplitudes.

Example:

Our work focuses on developing efficient calculational methods for explicit construction of *any* on-shell n -point *tree* amplitudes in $\mathcal{N} = 4$ super Yang-Mills theory and $\mathcal{N} = 8$ supergravity.

→ **Generating functions.**

Applications to intermediate state sums in unitarity cuts.

How to calculate on-shell tree level scattering amplitudes

- Feynman rules ← very many, very complicated diagrams
- On-shell recursion relations ← very useful
Get n -point amplitudes from k -point amplitudes with $k < n$.
- Generating functions ← very efficient
Idea: all n -point tree amplitudes of $\mathcal{N} = 4$ SYM encoded in a set of simple Grassmann functions Z_n^{MHV} , Z_n^{NMHV} , \dots , $Z_n^{\overline{\text{MHV}}}$:

$$A_n(X_1, X_2, \dots, X_n) = D_{X_1} D_{X_2} \cdots D_{X_n} Z_n$$

with differential operators D_{X_i} in 1-1 correspondence with the states X_j .

Advantage: obtain amplitude directly without having to first compute set of lower-point amplitudes.

MHV sector and beyond

SUSY \implies helicity violating n -gluon amplitudes vanish:

$$A_n(+, +, \dots, +) = A_n(-, +, \dots, +) = 0.$$

- The *simplest* amplitudes are **MHV** (maximally helicity violating)
 \rightarrow n -gluon amplitude $A_n(-, -, +, \dots, +)$

MHV sector: amplitudes related to A_n via SUSY Ward identities.

- The *next-to-simplest* amplitudes are **Next-to-MHV**
 \rightarrow n -gluon amplitude $A_n(-, -, -, +, \dots, +)$

NMHV sector: SUSY related (but much harder to solve SUSY Ward identities).

...

Properties of the generating function

→ Generating functions developed for MHV, NMHV amplitudes
+ for anti-MHV and anti-NMHV.

→ Precise characterization of MHV and NMHV sectors,
e.g. $A_6(\lambda_+ \lambda_+ \lambda_+ \lambda_+ \phi \phi)$ is MHV in $\mathcal{N} = 4$ SYM.

→ Counts distinct processes in each sector:

	MHV	NMHV
$\mathcal{N} = 4$:	15	34
$\mathcal{N} = 8$:	186	919

counting \leftrightarrow partitions of integers!

→ Simple relationship $Z_n^{\mathcal{N}=8} \propto Z_n^{\mathcal{N}=4} \times Z_n^{\mathcal{N}=4}$ (MHV)
clarifies SUSY and global symmetries in map
 $[\mathcal{N} = 8] = [\mathcal{N} = 4]_L \otimes [\mathcal{N} = 4]_R$ of states
and KLT relations $M_n = \sum(k_n A_n A'_n)$.

→ Evaluation of **state sums** in unitarity cuts of loop amplitudes.

- 1 Motivation
- 2 MHV generating functions in $\mathcal{N} = 4$ SYM
- 3 Intermediate State Spin Sums
- 4 Recursion relations \leftrightarrow MHV vertex expansion
- 5 Next-to-MHV generating functions in $\mathcal{N} = 4$ SYM
- 6 From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG
- 7 Outlook

I will use *spinor helicity* formalism:

- If momentum p_μ null, i.e. $p^2 = 0$, then

$$p_{\alpha\dot{\beta}} = p_\mu (\bar{\sigma}^\mu)^{\dot{\alpha}\beta} = |p\rangle^{\dot{\alpha}} [p]^\beta$$

with bra and kets being 2-component commuting spinors which are solutions to the massless Dirac eqn, $p_{\alpha\dot{\beta}} |p\rangle^{\dot{\beta}} = 0$.

- Spinor products $\langle 12 \rangle \equiv \langle p_1 |_{\dot{\alpha}} |p_2\rangle^{\dot{\alpha}}$ and $[12] = [p_1]^\alpha [p_2]_\alpha$ are just $\sqrt{|s_{12}|} = \sqrt{|2p_1 \cdot p_2|}$ up to a complex phase.
- Note $[ij] = -[ji]$ and $\langle ij \rangle = -\langle ji \rangle$.

2. MHV generating function — $\mathcal{N} = 4$ SYM

$$\begin{array}{ccc} \text{States } X_i & \leftrightarrow & \text{differential operators } D_{X_i} \\ \downarrow & & \downarrow \\ \text{Amplitude } A_n(X_1 X_2 \dots X_n) & = & D_{X_1} D_{X_2} \dots D_{X_n} Z_n \end{array}$$

First need (state \leftrightarrow diff op) correspondence.

$\mathcal{N} = 4$ SYM

$\mathcal{N} = 4$ SYM has 2^4 massless states:

$a, b = 1, 2, 3, 4 \in SU(4)$ global sym

1+1 gluons B^-, B_+

4+4 gluini F_a^-, F_+^a

6 self-dual scalars $B^{ab} = \frac{1}{2}\epsilon^{abcd}B_{cd}$

4 supercharges $\tilde{Q}_a = \epsilon_{\dot{\alpha}} \tilde{Q}_a^{\dot{\alpha}}$ and $Q^a = \tilde{Q}_a^*$ act on annihilation operators:

$$[\tilde{Q}_a, B_+(p)] = 0,$$

$$[\tilde{Q}_a, F_+^b(p)] = \langle \epsilon p \rangle \delta_a^b B_+(p),$$

$$[\tilde{Q}_a, B^{bc}(p)] = \langle \epsilon p \rangle (\delta_a^b F_+^c(p) - \delta_a^c F_+^b(p)), \quad (\text{consistent with crossing sym. and self-duality})$$

$$[\tilde{Q}_a, B_{bc}(p)] = \langle \epsilon p \rangle \epsilon_{abcd} F_+^d(p),$$

$$[\tilde{Q}_a, F_b^-(p)] = \langle \epsilon p \rangle B_{ab}(p),$$

$$[\tilde{Q}_a, B^-(p)] = -\langle \epsilon p \rangle F_a^-(p)$$

$\mathcal{N} = 4$ SYM (state \leftrightarrow diff op) correspondence

Introduce auxiliary Grassman variable η_{ia}

i momentum label p_i , $a = 1, \dots, 4$ is $SU(4)$ index.

Associate to each state Grassman diff ops $\partial_i^a = \frac{\partial}{\partial \eta_{ia}}$:

$$B_+(p_i) \leftrightarrow 1$$

$$F_+^a(p_i) \leftrightarrow \partial_i^a$$

$$B_+^{ab}(p_i) \leftrightarrow \partial_i^a \partial_i^b$$

$$F_a^-(p_i) \leftrightarrow -\frac{1}{3!} \epsilon_{abcd} \partial_i^b \partial_i^c \partial_i^d$$

$$B^-(p_i) \leftrightarrow \partial_i^1 \partial_i^2 \partial_i^3 \partial_i^4$$

This is our (state \leftrightarrow diff op) correspondence.

SUSY generators $\tilde{Q}_a = \sum_{i=1}^n \langle \epsilon i \rangle \eta_{ia}$ and $Q^a = \sum_{i=1}^n [i \epsilon] \frac{\partial}{\partial \eta_{ia}}$ give correct SUSY algebra

$$[Q^a, \tilde{Q}_b] = \delta_b^a \sum_{i=1}^n [\epsilon_1 i] \langle i \epsilon_2 \rangle = \delta_b^a \sum_{i=1}^n \epsilon_1^\alpha p_{i\alpha\dot{\beta}} \tilde{\epsilon}_2^{\dot{\beta}} \rightarrow 0 \quad (\text{mom. cons.}),$$

and

$$[\tilde{Q}, \text{diff op}] = \langle \epsilon p \rangle (\text{diff op})'$$

produces correct algebra on states.

The **MHV generating function** is

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}\left(\sum_i |i\rangle \eta_{ia}\right),$$

where $\delta^{(8)}\left(\sum_i |i\rangle \eta_{ia}\right) = 2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}$.

[Nair (1988)] [GGK (2004)]

(δ -function of Grassman variables θ_a is $\prod \theta_a$)

- η_{ia} — auxilliary Grassman variables
- $a = 1, 2, 3, 4$ — $SU(4)$ indices
- $i, j = 1, 2, \dots, n$ — momentum labels

Claim: any 8th order derivative operator built from (state \leftrightarrow diff op) correspondence gives an MHV amplitude when applied to $Z_n^{\mathcal{N}=4}$:

$$A_n^{\text{MHV}}(X_1, \dots, X_n) = D_{X_1} \cdots D_{X_n} Z_n^{\mathcal{N}=4}.$$

Let's prove this!

Proof:

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}(\sum_i |i\rangle \eta_{ia})$$

- $Z_n^{\mathcal{N}=4}$ reproduces pure MHV gluon amplitude $A_n(1^-, 2^-, 3^+, \dots, n^+)$ correctly:

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) \\ &= (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}) \\ &= \langle 12 \rangle^4. \end{aligned}$$

Proof:

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}(\sum_i |i\rangle \eta_{ia})$$

- $Z_n^{\mathcal{N}=4}$ reproduces pure MHV gluon amplitude $A_n(1^-, 2^-, 3^+, \dots, n^+)$ correctly:

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) \\ &= (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}) \\ &= \langle 12 \rangle^4. \end{aligned}$$

- $\tilde{Q}_a Z_n^{\mathcal{N}=4} \propto (\sum_{i=1}^n |i\rangle \eta_{ia}) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) = 0.$

Proof:

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}(\sum_i |i\rangle \eta_{ia})$$

- $Z_n^{\mathcal{N}=4}$ reproduces pure MHV gluon amplitude $A_n(1^-, 2^-, 3^+, \dots, n^+)$ correctly:

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) \\ &= (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}) \\ &= \langle 12 \rangle^4. \end{aligned}$$

- $\tilde{Q}_a Z_n^{\mathcal{N}=4} \propto (\sum_{i=1}^n |i\rangle \eta_{ia}) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) = 0.$
- $[\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = 0$

encode the MHV SUSY Ward identities:

$$0 = [\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = \sum_t D_{X_t} \cdots [\tilde{Q}_a, D_{X_t}] \cdots D_{X_n} Z_n^{\mathcal{N}=4},$$

$$0 = \langle [\tilde{Q}_a, X_1 \cdots X_n] \rangle = \sum_t \langle X_1 \cdots [\tilde{Q}_a, X_t] \cdots X_n \rangle.$$

Proof:

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}(\sum_i |i\rangle \eta_{ia})$$

- $Z_n^{\mathcal{N}=4}$ reproduces pure MHV gluon amplitude $A_n(1^-, 2^-, 3^+, \dots, n^+)$ correctly:

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) \\ &= (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}) \\ &= \langle 12 \rangle^4. \end{aligned}$$

- $\tilde{Q}_a Z_n^{\mathcal{N}=4} \propto (\sum_{i=1}^n |i\rangle \eta_{ia}) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) = 0.$

- $[\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = 0$

encode the MHV SUSY Ward identities:

$$0 = [\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = \sum_t D_{X_t} \cdots [\tilde{Q}_a, D_{X_t}] \cdots D_{X_n} Z_n^{\mathcal{N}=4},$$

$$0 = \langle [\tilde{Q}_a, X_1 \cdots X_n] \rangle = \sum_t \langle X_1 \cdots [\tilde{Q}_a, X_t] \cdots X_n \rangle.$$

- MHV SUSY Ward identities have *unique* solutions.

Proof:

$$Z_n^{\mathcal{N}=4}(\eta_{ia}) = \frac{A_n(1^-, 2^-, 3^+, \dots, n^+)}{\langle 12 \rangle^4} \delta^{(8)}(\sum_i |i\rangle \eta_{ia})$$

- $Z_n^{\mathcal{N}=4}$ reproduces pure MHV gluon amplitude $A_n(1^-, 2^-, 3^+, \dots, n^+)$ correctly:

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) \\ &= (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1 \partial_2^2 \partial_2^3 \partial_2^4) (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja}) \\ &= \langle 12 \rangle^4. \end{aligned}$$

- $\tilde{Q}_a Z_n^{\mathcal{N}=4} \propto (\sum_{i=1}^n |i\rangle \eta_{ia}) \delta^{(8)}(\sum_i |i\rangle \eta_{ia}) = 0.$

- $[\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = 0$

encode the MHV SUSY Ward identities:

$$0 = [\tilde{Q}_a, D^{(9)}] Z_n^{\mathcal{N}=4} = \sum_t D_{X_t} \cdots [\tilde{Q}_a, D_{X_t}] \cdots D_{X_n} Z_n^{\mathcal{N}=4},$$

$$0 = \langle [\tilde{Q}_a, X_1 \cdots X_n] \rangle = \sum_t \langle X_1 \cdots [\tilde{Q}_a, X_t] \cdots X_n \rangle.$$

- MHV SUSY Ward identities have *unique* solutions.

$\Rightarrow Z_n^{\mathcal{N}=4}$ produces all MHV amplitudes correctly.

Characterizing amplitudes in the MHV sector of $\mathcal{N} = 4$ SYM:

$$D^{(8)} Z_n^{\mathcal{N}=4} = \text{MHV amplitude}$$

hence

$$\# \text{ MHV amplitudes} = \# \text{ partitions of 8 with } n_{\max} = 4.$$

MHV amplitudes:

$$\begin{aligned} 8 &= 4 + 4 && \leftrightarrow \langle B^- B^- B_+ \dots B_+ \rangle \\ &= 4 + 3 + 1 && \leftrightarrow \langle B^- F_a^- F_+^a B_+ \dots B_+ \rangle \\ &\dots \\ &= 1 + \dots + 1 && \leftrightarrow \langle F_+^{a_1} \dots F_+^{a_8} B_+ \dots B_+ \rangle \end{aligned}$$

Total of **15 MHV amplitudes** in $\mathcal{N} = 4$ SYM.

Example:

Calculate $\langle B^-(p_1) F_+^1(p_2) F_+^2(p_3) F_+^3(p_4) F_+^4(p_5) B^+(p_6) \rangle$

$$\begin{aligned} & (\partial_1^1 \partial_1^2 \partial_1^3 \partial_1^4) (\partial_2^1) (\partial_3^2) (\partial_4^3) (\partial_5^4) \delta^{(8)} \left(\sum_i |i\rangle \eta_{ia} \right) \\ &= (\partial_1^1 \partial_2^1) (\partial_1^2 \partial_3^2) (\partial_1^3 \partial_4^3) (\partial_1^4 \partial_5^4) \delta^{(8)} \left(\sum_i |i\rangle \eta_{ia} \right) \\ &= \langle 12 \rangle \langle 13 \rangle \langle 14 \rangle \langle 15 \rangle \end{aligned}$$

using $\delta^{(8)} \left(\sum_i |i\rangle \eta_{ia} \right) = (2^{-4} \prod_{a=1}^4 \sum_{i,j=1}^n \langle ij \rangle \eta_{ia} \eta_{ja})$,

so

$$\begin{aligned} & \langle B^-(p_1) F_+^1(p_2) F_+^2(p_3) F_+^3(p_4) F_+^4(p_5) B^+(p_6) \rangle \\ &= \frac{\langle 12 \rangle \langle 13 \rangle \langle 14 \rangle \langle 15 \rangle}{\langle 12 \rangle^4} A_n(1^-, 2^-, 3^+, 4^+, 5^+, 6^+). \end{aligned}$$

- 1 Motivation
- 2 MHV generating functions in $\mathcal{N} = 4$ SYM
- 3 Intermediate State Spin Sums
- 4 Recursion relations \leftrightarrow MHV vertex expansion
- 5 Next-to-MHV generating functions in $\mathcal{N} = 4$ SYM
- 6 From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG
- 7 Outlook

3. Intermediate state sum

Example: One-loop MHV amplitude

Use **MHV** generating function to compute intermediate state sum of unitarity cut:

$$D_{l_1}^{(4)} D_{l_2}^{(4)} \left[\delta^{(8)}(I) \delta^{(8)}(J) \right]$$

D_{l_1} and D_{l_2} distribute themselves between $\delta^{(8)}(I)$ and $\delta^{(8)}(J)$.
This automatically takes care of the intermediate state sum.

How to evaluate the spin sum: $D_{l_1}^{(4)} D_{l_2}^{(4)} \left[\delta^{(8)}(I_a) \delta^{(8)}(J_a) \right]$

$$I_a = |l_1\rangle \eta_{1a} - |l_2\rangle \eta_{2a} + \sum_{\text{ext } i} |i\rangle \eta_{ia}$$

$$J_a = -|l_1\rangle \eta_{1a} + |l_2\rangle \eta_{2a} + \sum_{\text{ext } j} |j\rangle \eta_{ja}$$

Use δ -function identity $\delta^{(8)}(I_a) \delta^{(8)}(J_a) = \delta^{(8)}(I_a + J_a) \delta^{(8)}(J_a)$ and note that

- $\delta^{(8)}(I_a + J_a) = \delta^{(8)}(\text{ext})$ is independent of loop momenta.
- $\delta^{(8)}(J_a) = 2^{-4} \prod_{a=1}^4 \sum_{j,j' \in J} \langle jj' \rangle \eta_{ja} \eta_{j'a} = \prod_{a=1}^4 (\langle l_1 l_2 \rangle \eta_{1a} \eta_{2a} + \dots)$.

So

$$D_{l_1}^{(4)} D_{l_2}^{(4)} \left[\delta^{(8)}(I_a) \delta^{(8)}(J_a) \right] = \delta^{(8)}(\text{ext}) D_{l_1}^{(4)} D_{l_2}^{(4)} \delta^{(8)}(J_a) = \delta^{(8)}(\text{ext}) \langle l_1 l_2 \rangle^4.$$

Include prefactors and you have a *generating function* for the cut amplitude!

3. Intermediate state sum

Example: One-loop MHV amplitude

Use **MHV** generating function to compute intermediate state sum of unitarity cut:

$$D_{l_1}^{(4)} D_{l_2}^{(4)} \left[\delta^{(8)}(I) \delta^{(8)}(J) \right]$$

D_{l_1} and D_{l_2} distribute themselves between $\delta^{(8)}(I)$ and $\delta^{(8)}(J)$.
This automatically takes care of the intermediate state sum.

Have done 1-, 2-, 3-, and 4-loop state sums involving **MHV**, **NMHV**, **MHV**, and **NMHV** generating functions in $\mathcal{N} = 4$.

- 1 Motivation
- 2 MHV generating functions in $\mathcal{N} = 4$ SYM
- 3 Intermediate State Spin Sums
- 4 Recursion relations \leftrightarrow MHV vertex expansion
- 5 Next-to-MHV generating functions in $\mathcal{N} = 4$ SYM
- 6 From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG
- 7 Outlook

4. Recursion relations \leftrightarrow MHV vertex expansion

- **Recursion relations:** express on-shell n -point amplitude in terms of k -point on-shell sub-amplitudes with $k < n$.
- Even better if sub-amplitudes are MHV
→ **MHV vertex expansion.**

For gluons:

[Britto, Cachazo, Feng (2004)] [Britto, Cachazo, Feng, Witten (2005)] [Cachazo, Svrcek, Witten (2004)] [Risager (2005)]

For general $\mathcal{N} = 4$ external state:

[Bianchi, Freedman, HE (May 2008)]
[Freedman, Kiermaier, HE (Aug 2008)]

[Cheung (2008)] [–, anything)-shift OK
[Arkani-Hamed, Cachazo, Kaplan (2008)] new 2-line SUSY shift.
[Brandhuber, Heslop, Travaglini (2008)]
[Drummond, Henn (2008)]

3-line shift recursion relations

- ▶ Analytically continue amplitudes to complex values by *shifts* of 3 external momenta:

$$p_i^\mu \rightarrow \hat{p}_i^\mu = p_i^\mu + z q_i^\mu, \quad \text{for } i = 1, 2, 3.$$

where

$$q_1^\mu + q_2^\mu + q_3^\mu = 0 \quad \leftrightarrow \quad \text{momentum conservation}$$

$$q_i^2 = 0 = q_i \cdot p_i \quad \leftrightarrow \quad \text{on-shell } \hat{p}_i^2 = 0.$$

Achieved by $|1] \rightarrow |\hat{1}] = |1] + z\langle 23|X]$ (+ cyclic)
with $|X]$ arbitrary “reference spinor”.

- ▶ The tree amplitude $A_n(z)$ has only simple poles, so **if** $A_n(z) \rightarrow 0$ for $z \rightarrow \infty$, then

$$0 = \oint \frac{A_n(z)}{z} \quad \rightarrow \quad A_n(0) = - \sum_{z \neq 0} \text{Res} \frac{A_n(z)}{z}$$

3-line shift recursion relations \rightarrow NMHV gen func

- Result is on-shell recursion relation

$$A_n(0) = \sum_I A_{n_1} \frac{1}{p_I^2} A_{n_2}, \quad n_1 + n_2 = n + 2$$

The special 3-line shift ensures that the sub-amplitudes are both MHV if A_n is NMHV. [Risager (2005)]

The diagram shows an equality between a single vertex and a sum of two vertices. The left vertex is a circle with n external lines (some solid, some dashed) and is labeled "NMHV". The right side is a sum over an index I of two vertices connected by a horizontal line. Each of these two vertices is a circle with external lines and is labeled "MHV".

\rightarrow Now use this to get NMHV gen func.

5. Next-to-MHV generating functions — $\mathcal{N} = 4$ SYM

- ▶ Consider a single MHV vertex diagram:

- ▶ Apply MHV gen func to each vertex to derive (details omitted)

$$\Omega_{n,l}^{\mathcal{N}=4} = \frac{A_{n,l}^{\text{gluons}}}{\langle m_1 P_l \rangle^4 \langle m_2 m_3 \rangle^4} \delta^{(8)}(L_a + R_a) \prod_{a=1}^4 \langle P_l L_a \rangle$$

where $L_a = \sum_{i \in L} |i\rangle \eta_{ia}$ and $R_a = \sum_{j \in R} |j\rangle \eta_{ja}$.

[Georgio, Glover and Khoze (2004)]

- ▶ Each term in $\Omega_{n,l}^{\mathcal{N}=4}$ is order 12 in η_{ia} 's.
- ▶ Value of diagram is $D^{(12)} \Omega_{n,l}^{\mathcal{N}=4}$ with $D^{(12)}$ built from the external states.
- ▶ Sum all diagram gen func's to get full NMHV gen func:

$$\Omega_n^{\mathcal{N}=4} = \sum_l \Omega_{n,l}^{\mathcal{N}=4}$$

Example:

NMHV gluon amplitude

$$A_n(1^-, 2^-, 3^-, 4^+, \dots, n^+) = D_1^{(4)} D_2^{(4)} D_3^{(4)} \Omega_n^{\mathcal{N}=4}$$

Partition $12 = 4+4+4$.

$\mathcal{N} = 4$ SYM:

NMHV amplitudes = # partitions of 12 with $n_{\max} = 4$.

Total of 34.

But...

We used MHV vertex expansion from 3-line shift recursion relations, which *assumed*

$$A_n(z) \rightarrow 0 \quad \text{for} \quad z \rightarrow \infty.$$

Is this OK?

But...

We used MHV vertex expansion from 3-line shift recursion relations, which *assumed*

$$A_n(z) \rightarrow 0 \quad \text{for} \quad z \rightarrow \infty.$$

Is this OK?

YES! [Freedman, Kiermaier, HE (Aug 2008)] .

— *provided the three lines share a common (upper) $SU(4)$ index.*

In $\mathcal{N} = 4$ SYM, $A_n(\hat{1}, \dots, \hat{i}, \dots, \hat{j}, \dots) \rightarrow 0$ for $z \rightarrow \infty$ when the 3 shifted states 1, i, j share a common (upper) $SU(4)$ index.

Outline of proof:

- Consider first amplitude A_n with state 1 a $-ve$ helicity gluon.
- Use [Cheung (2008)]'s result that $[1^-, k]$ -shift gives valid BCFW 2-line shift recursion relations

$$A_n = \sum \left(\text{MHV} \text{ MHV} + \text{NMHV} \overline{\text{MHV}} \right)$$

- Perform subsequent $[1, i, j]$ -shift: The as $z \rightarrow \infty$:
 diagrams $\text{MHV} \times \text{MHV} \rightarrow \mathcal{O}(\frac{1}{z})$
 diagrams $\text{NMHV}_{n-1} \times \overline{\text{MHV}}_3 \rightarrow \mathcal{O}(\frac{1}{z})$ using inductive assumption.
- Basis of induction established by careful examination of $n = 6$ cases.
- So $A_n(\hat{1}^-, \dots, \hat{i}, \dots, \hat{j}, \dots) \rightarrow 1/z$ for large z .
- Use SUSY Ward identities to generalize state 1 to any $\mathcal{N} = 4$ state sharing a common index with i and j .

Summary — $\mathcal{N} = 4$ SYM

This proves the validity of the NMHV generating function in $\mathcal{N} = 4$ SYM. It also shows that the MHV vertex expansion is valid for all external states.

Also, the generating function is **unique**: once established, it does not know which valid 3-line shift it came from!

Anti-(N)MHV: The generating function for $\overline{(\text{N})\text{MHV}}$ can be obtained from that of (N)MHV by a Grassman Fourier transform.

We have successfully applied our generating functions to the evaluation of several 1-, 2-, 3-, and 4-loop intermediate state sums.

- 1 Motivation
- 2 MHV generating functions in $\mathcal{N} = 4$ SYM
- 3 Intermediate State Spin Sums
- 4 Recursion relations \leftrightarrow MHV vertex expansion
- 5 Next-to-MHV generating functions in $\mathcal{N} = 4$ SYM
- 6 From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG
- 7 Outlook

6. From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG

- $\mathcal{N} = 8$ SG has 2^8 massless states:
1 graviton $^\pm$, 8 gravitinos $^\pm$, 28 gravi-photons $^\pm$,
56 gravi-photinos $^\pm$, 70 self-dual scalars ϕ_{abcd} .
Global $SU(8)$ symmetry.

6. From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG

- $\mathcal{N} = 8$ SG has 2^8 massless states:
1 graviton $^\pm$, 8 gravitinos $^\pm$, 28 gravi-photons $^\pm$,
56 gravi-photinos $^\pm$, 70 self-dual scalars ϕ_{abcd} .
Global $SU(8)$ symmetry.
- MHV generating function generalizes directly.
 - Useful for testing map
 $[\mathcal{N} = 4] \times [\mathcal{N} = 4] = [\mathcal{N} = 8]$
at tree level
 - Relationship between global symmetries
 $SU(4) \times SU(4) \leftrightarrow SU(8)$
included in map and generating functions.

6. From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG

- $\mathcal{N} = 8$ SG has 2^8 massless states:
1 graviton $^\pm$, 8 gravitinos $^\pm$, 28 gravi-photons $^\pm$,
56 gravi-photinos $^\pm$, 70 self-dual scalars ϕ_{abcd} .
Global $SU(8)$ symmetry.
- MHV generating function generalizes directly.
 - Useful for testing map
 $[\mathcal{N} = 4] \times [\mathcal{N} = 4] = [\mathcal{N} = 8]$
at tree level
 - Relationship between global symmetries
 $SU(4) \times SU(4) \leftrightarrow SU(8)$
included in map and generating functions.
- Natural implementation of NMHV generating function.
 - but it doesn't work for all possible external states
of $\mathcal{N} = 8$ SG!
 - because the MHV vertex expansion fails in these cases!

From $\mathcal{N} = 4$ SYM to $\mathcal{N} = 8$ SG (cont'd)

Large z for pure graviton n -point amplitude:

$$M_n(\hat{1}^-, \hat{2}^-, \hat{3}^-, 4^+, \dots, n^+) \rightarrow z^{n-12} \quad \text{for } z \rightarrow \infty$$

Numerically verified for $n = 5, \dots, 11$.

- When the $M_n(z)$ does not vanish for large z the $O(1)$ -term contributes as the residue of the pole at infinity. No (known) amplitude factorization that allows systematic calculation of this part.
- Also “bad” large z behavior for lower point amplitudes, for instance no good 3-line shifts for $\langle \phi^{1234} \phi^{1358} \phi^{1278} \phi^{5678} \phi^{2467} \phi^{3456} \rangle$.
- **Intermediate state sums** in unitarity cuts of $\mathcal{N} = 8$ SG loop amplitudes performed in terms of $\mathcal{N} = 4$ SYM via the KLT (Kawai-Lewellen-Tye) relations $M_n \sim \sum(k.f.) A_n A'_n$.

7. Outlook

Loops in $\mathcal{N} = 8$ supergravity

Is there a connection between “bad” large z behavior in supergravity tree amplitudes and potential UV divergencies?

Role of $E_{7,7}$?

- 70 scalars of $\mathcal{N} = 8$ SG are Goldstone bosons of spontaneously broken $E_{7,7} \rightarrow SU(8)$.
- How will $E_{7,7}$ reveal itself?
→ soft-scalar limits of amplitudes
(analogous to soft-pion low-energy theorems of Adler).
- We find that 1-soft-“pion” limits of $\mathcal{N} = 8$ tree amplitudes *vanish*.
- Note that in pion physics 1-pion soft limits do not necessarily vanish, even in models with pions and nucleons both massless.
- Since our May paper: new results by [Arkani-Hamed, Cachazo, Kaplan (2008)]
